Combustion. The subject of the combustion of fuels being one in which every engineer is vitally interested, it is proper that its leading features and principles be discussed. One of the main factors in the combustion of coal is the proper supply of air. Air is composed of two gases, oxygen and nitrogen, in the proportion, by volume, of 21 per cent. of oxygen and 79 per cent. of nitrogen, or by weight, 23 per cent. of oxygen and 77 per cent. of nitrogen. The composition of pure dry air, as given by Kent in Steam Boiler Economy, is as follows: By volume, 20.91 parts O. and 79.09 parts N. By weight, 23.15 parts O. and 76.85 parts N. Air is a mixture and not a chemical combination of these two elements. The principal constituent of coal and most other fuels, whether solid, liquid or gaseous, is carbon. Hydrogen is a light combustible gas and combined either with carbon or with carbon and oxygen, in various proportions, is also a valuable constituent of fuels, notably of bituminous coal. The heating value of one pound of pure carbon is rated at 14,500 heat units, while one pound of hydrogen gas contains 62,000 heat units. Analysis of coal shows that it. contains moisture, fixed carbon, volatile matter, ash and sulphur in various proportions according to...
